

TAKE CONTROL OF YOUR DATA WITH MEZMO OBSERVABILITY PIPELINE

IMPROVE EFFICIENCY WHILE OPTIMIZING SPEND

MEZMO

Production Engineers across Development, ITOps, and Security use observability data to better understand their systems, respond to issues faster, and ultimately provide their users with more performant and secure experiences. Digital business, cloud adoption and microservices architectures have led to an explosion of data. But while the necessity of observability data is well understood, teams struggle to derive value from it.

Teams across the organization need to easily (and cost-effectively) centralize data from multiple sources, transform it to make it more actionable, and route it to various destinations to empower everyone with that data to enhance agility, efficiency, and security.

MEZMO OBSERVABILITY PIPELINE

Mezmo helps organizations better control their observability data to drive actionability. Centralize data from various sources, apply out-of-the-box and custom processors to make that data more valuable, and route that data to end destinations for further analysis, including Mezmo's Log Analysis platform.

USE CASES

+ REDUCE COSTS

Mezmo allows you to manage multiple sources and destinations from a single control pane, and you only pay for the data you keep and pass downstream. Processors to remove low-value fields and sample chatty services help reduce data volume to optimize spend without losing observable surface area. Log Analysis provides a low-cost temporary data store to analyze and take action on log data.

+ REDUCE MTTD AND MTTR

Mezmo aggregates data from any source and makes it searchable from an easy-to-use platform. Automatic and custom parsers, enrichment, and correlation capabilities make that data more actionable. Set alerts so you can act sooner. Store data within flexible retention periods, automatically route them to low-cost storage, and restore it for further analysis and action. Control features protect against runaway data flow.

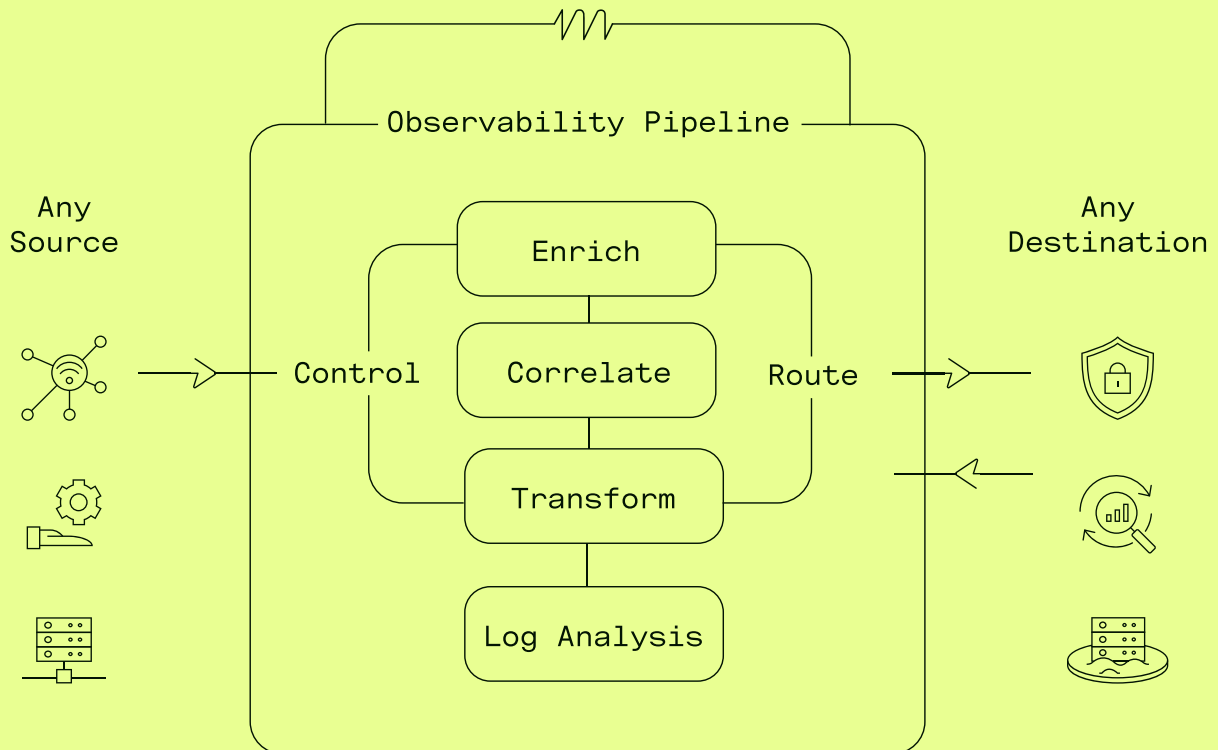

+ OPTIMIZE EXISTING DATA FLOWS

Mezmo allows teams to easily restructure and augment data flows to help you optimize how and where you consume it. Add multiple destinations to stream data in real-time without interrupting critical flows (e.g. to a SIEM). Processors transform data into consumable formats for each destination, ensuring a seamless experience.

+ ENSURE DATA COMPLIANCE

Mezmo helps transform sensitive data to meet regulatory and compliance requirements. Scrub PII data so it is compliant when it reaches a SIEM or audit platform. The encryption processor masks data while it is in motion, but allows for decryption and further analysis when it reaches its destination.

HOW IT WORKS

AGGREGATE FROM MANY SOURCES

Gain comprehensive visibility by collecting data across various streams. Mezmo's out-of-the-box integrations across many sources and source types make it simple to collect any data.

TRANSFORM DATA FOR MORE CLARITY

Powerful processors ensure data fidelity and compliance, all while optimizing to ensure you are only routing the insights you need, helping save on costs.

ROUTE FOR FURTHER ANALYSIS OR STORAGE

Stream data to SIEM for further analysis, or a data lake for compliance. Comprehensive intelligent rules optimize data flow without increasing complexity and IT spend.
